

SEMINARIO DI MATEMATICA APPLICATA

Mercoledì 10 Settembre 2014, ore 12.30
Sala di Rappresentanza, Dipartimento di Matematica (Via Saldini 50, Milano)

Hybrid Modelling of Tumor-induced Angiogenesis

Luis Lopez Bonilla

Gregorio Millan Institute
Escuela Politecnica Superior
Universidad Carlos III de Madrid

When modeling of tumor-driven angiogenesis, a major source of analytical and computational complexity is the strong coupling between the kinetic parameters of the relevant stochastic branching-and-growth of the capillary network, and the family of interacting underlying fields. To reduce this complexity, we take advantage of the system intrinsic multiscale structure: we describe the stochastic cell dynamics at their natural microscale, whereas we describe the deterministic dynamics of the underlying fields at a larger macroscale. We set up a conceptual stochastic model including branching, elongation, and anastomosis of vessels and derive a mean field approximation for their densities. This leads to a deterministic integro-partial differential system that describes the formation of the stochastic vessel network. We discuss the proper capillary injecting boundary conditions and find a reduced description by Chapman-Enskog perturbation methods. We include the results of relevant numerical simulations.
